

Ian Lee

Make it work. Then make it better.

Building AI systems that actually ship.

About

Product-minded engineer working across AI, data, and full-stack delivery. I focus on systems that ship: clear requirements, reliable pipelines, and interfaces people can trust. Based on the portfolio at rockin0130.github.io.

Focus areas

- **AI & ML** — intent understanding, embeddings, cloud AI APIs, explainable outputs.
- **Data** — integration, cleansing, SQL analytics, dashboards (Tableau).
- **Product engineering** — React web apps, mobile (Capacitor), calendar integrations, browser extensions.

Tech stack highlights

Python, VBA, SQL, Tableau · React, Capacitor · Google Cloud AI · Google Calendar / Apple Calendar APIs · Embedding-based models · Browser extension development

Data-Driven Global Marketing Integration

Hyundai Motor Group | Data Assistant

Technologies: Python, VBA, SQL, Tableau

Overview

Innocean, a subsidiary of Hyundai Motor Group, leads global marketing for Hyundai Motor Company and its premium brand, Genesis.

Within the Global Strategy Planning team, Genesis faced challenges in consolidating marketing performance, as each international branch independently executed and reported campaigns. This lack of standardization limited visibility into global operations and hindered data-driven decision-making at headquarters.

What I Did

I integrated and cleansed fragmented global marketing data using Python and VBA, transforming it into a unified, query-ready dataset of 1,000+ records.

Building on this foundation, I developed a global marketing tracker using SQL and Tableau, incorporating trend analysis and interactive dashboards (Gantt charts and tree maps) to standardize campaign reporting.

This system centralized marketing data across 10+ international branches, enabling consistent cross-regional comparison and operational visibility for the first time.

Impact

The tracker enabled headquarters to benchmark past campaigns and plan future marketing initiatives in emerging markets such as Indonesia and India, contributing to a projected 12% increase in Genesis brand revenue.

Additionally, improved visibility into campaign timelines allowed HQ to identify inefficiencies in European marketing processes, leading to optimizations that contributed to a 15% increase in regional sales.

AI Scheduling Assistant

WideCity | Lead Product Engineer

Technologies: React, Capacitor, Google Calendar & Apple Calendar APIs, Google Cloud AI

Overview

Currently developing a startup product under the advisory of Edward Kim (CTO at Gusto), in collaboration with cross-functional team members across finance and law.

The product reimagines the traditional personal calendar into a shared, relationship-centric platform, enabling users to coordinate schedules with partners, friends, and family.

By integrating AI, the system allows flexible and personalized scheduling based on user preferences, context, and intent.

What I Built

I generated the initial web application using Lovable AI, then refined and extended the system using React by resolving bugs and improving core functionality.

I converted the application into a cross-platform iOS app using Capacitor and implemented integrations with Google Calendar and Apple Calendar, enabling seamless synchronization of user schedules.

I also improved Apple Calendar-related UI/UX issues to ensure consistency across platforms.

On the AI side, I evaluated multiple approaches and integrated Google Cloud AI APIs. I designed the core logic enabling the system to interpret user intent and dynamically adapt scheduling decisions,

creating a more personalized and interactive experience.

Impact (Pre-Launch)

The product is currently in its final pre-launch stage, with a soft launch scheduled this month.

It is designed to reduce manual coordination overhead and improve scheduling efficiency through AI-driven decision support. By enabling multi-user coordination and personalized AI interactions, the system aims to streamline how users plan and manage their time across personal and social contexts.

Fashion Extension

Marshall Artificial Intelligence Association | Lead AI Engineer

Technologies: Embedding models, browser extension, end-to-end AI pipeline

Overview

This project was developed as part of the Marshall Artificial Intelligence Association (MAIA) to address a common problem among users who lack confidence in their fashion decisions.

We built a browser extension that evaluates clothing items directly on e-commerce websites, providing a compatibility score and explanation based on a user's personal style profile.

The goal was to deliver real-time, personalized decision support embedded directly into the online shopping experience.

What I Built

As Lead AI Engineer, I designed the core AI system and defined how it integrates with the overall product pipeline.

I evaluated multiple approaches including rule-based methods, image classification, and embedding-based models, and selected an embedding-based style similarity model as the most scalable solution for the MVP.

I designed the end-to-end AI pipeline, where the extension extracts product data such as images and metadata and combines it with user profile inputs. The system converts these inputs into embeddings

and computes a compatibility score based on similarity.

I also defined key AI capabilities including visual attribute analysis, user preference modeling, compatibility scoring, and explanation generation, ensuring outputs were both interpretable and actionable.

Impact

The MVP was successfully launched, and early testing demonstrated strong alignment between AI-generated scores and user preferences.

In a user survey, over 80% of participants (40 out of 50) reported that the recommendations closely matched their personal taste, validating the effectiveness of the system.

The project has been selected for a demo presentation to industry leaders, including the CEO of LinkedIn and the CFO of Google, highlighting both its technical depth and practical relevance.
